It would be a nice feature if when you request a stack to be made the software defaults the image type to the type against which the picking was done. I.e. right now you can choose a picking run done on en images and then have the stack run on en1 and then it simply fails. The software should (1) default to the image type appropriate to the picking run and (2) if the user overrides this then a warning check should be posted or the user should have to override the warning. I do not know of a circumstance where you would want to choose picks done at one image type and make a stack based on these on a different image type but perhaps there is some such circumstance?
